Subject: Inputs for Phase 4 — replies to the requirements you shared

Reference: ORZ/VISION/2026/DEV-P4-REPLY

Thanks for sharing the list of inputs you need to start Phase 4. At this stage we are still building Orzen Vision as a product and do not have a fixed first client to anchor the actual data against. So the answers below are **scenario-based** — written for a typical multi-store jewellery retail brand. Please use these as the working baseline for the build. Once we land our first live client, we will refine the specifics together.

1. Store Layouts

We can share a sample floor plan from an existing jewellery retail client format — a typical showroom is roughly 3,000 to 5,000 sq ft. The standard set of zones we need the platform to support is: **Entry / Reception, Customer Lounge, Diamond Counter, Gold Counter, Bridal Section, Silver & Lifestyle, Try-On Rooms, Billing / Cashier, Back Office, Vault and Staff Area**. Each store should be able to add, rename or retire zones from the admin panel — no two stores will be identical. Cameras get tagged to a zone, and the dashboard / reports should always allow a zone-level view. Vault, Back Office and Staff Area should be flagged as restricted, so they are visible only to senior roles.

2. User Roles & Access

Six roles to begin with:

- **Super Admin** — Orzen team, full access across the platform.
- **Brand Admin** — the client's senior HR or operations head; full access within their brand.
- **Regional Manager** — sees and approves for the stores in their region only.
- **Store Manager** — sees their own store; raises and approves at store level.
- **Staff / Employee** — self-service only; can see their own attendance, leave and payslip — nothing else.
- **Auditor** — read-only access across all stores; for compliance and audit teams.

Two optional roles to keep in mind as we go: **HR Manager** (HRMS-module focused) and **Analytics Viewer** (read-only across analytics, for marketing or BI teams). Permissions are role-based, with the principle that a person only ever sees what their role needs to do its job.

3. Dashboard & Reporting

The headline KPIs we want on the dashboard:

- Headcount today vs scheduled (per store and across the network).
- Attendance rate %.
- Late arrivals and no-shows.
- Hours worked this week.
- Pending approvals (leave, overtime, shift swap).
- Overtime trend and top-performing site.
- Visitor footfall and demographics (when enabled).

Two main dashboard views: **HR Director / Brand Admin** — the whole-network view; and **Store Manager** — single-store view. We already designed reference layouts for both in the Orzen Vision pitch deck; please build to those visual specifications.

Reports must be exportable in **PDF, Excel and CSV** formats. Cadence:

- Real-time — attendance, headcount and exceptions on the dashboard.
- Daily — end-of-day attendance summary, by email.

- Weekly — Tuesday morning digest to HR and Regional Managers.
- Monthly — compliance and payroll-ready attendance summary.
- Quarterly — trend report.

4. POS Integration

We do not have a fixed POS vendor yet. The most common in Indian jewellery retail is **Ginesys** — please build for that as the primary reference. We should also be able to plug into **SAP for Retail, Oracle Retail, GoFrugal and Tally** using the same REST adapter pattern.

For sample data, here is the profile of a typical store the platform should be built to handle:

- Showroom size: ~6,000 sq ft.
- Average daily walk-ins: ~100 customers.
- Reported conversion: ~50% — so about 50 transactions per day per store.
- Average bill value: ~₹1,00,000.

That works out to roughly **₹50 lakh in daily revenue per location**. For a 100-store network, the platform should be sized to ingest around 5,000 transactions a day. A 300-store network — around 15,000 a day.

A typical bill at the ₹1 lakh ticket size could be any of these patterns:

- **Gold chain (single item)**. 22K gold, 14 grams, gold rate ₹6,500/gm, making charges 8%, GST 3% — total ~₹1,01,000.
- **Diamond ring**. 18K gold (4 grams) with a 0.5 carat solitaire, making charges ₹15,000, GST 3% — total ~₹1,02,000.
- **Multi-item festive purchase**. A gold ring (4g), pair of earrings (8g) and a pendant (3g), all 22K, making charges 8%, GST 3% — total ~₹1,08,000.

From each bill we capture: the customer's phone, the items (with metal type, weight, stone weight where applicable, and making charges), the GST split, the total amount, and the billing staff member. The **customer phone is the bridge** — it matches back to the same phone-number-hash that Vision used to recognise the customer at entry. That gives us **footfall-to-conversion**, which is something the merchandise team has never really had before.

One thing worth flagging: the 50% conversion is what the store currently reports — but it is estimated against a walk-in counter at the door that is often manually maintained. Once Vision is in place, with the camera counting walk-ins automatically, the brand will see the **true conversion rate** for the first time. The reported figure is what we benchmark against — and very likely improve.

5. HRMS Integration

No fixed HRMS chosen yet either. The most common modern choice in Indian mid-market is **Keka HR** — let's build for that as the primary reference. We should also support **Zoho People, Darwinbox and GreytHR** through the same adapter.

Employee data we will need from the HRMS:

- Employee ID, name, phone, email.
- Role, department, store assigned, reporting manager.
- Joining date, shift pattern, active status.

On attendance and shift management: Vision pushes every check-in and check-out event to the HRMS as it happens. The HRMS is the source of truth for **leave** and the **employee master**; Vision is the source of truth for **attendance and time on site**. Shift patterns come from the HRMS; Vision uses them to flag late and no-show. Overtime is computed by Vision and approved in the HRMS.

6. Loyalty CRM Integration

The most common loyalty platform in Indian retail is **Capillary Technologies** — please build for that as the primary reference. Also support **WebEngage, MoEngage and CleverTap**. The identity bridge across all of them is the customer's phone number (hashed for DPDP compliance).

Customer profile fields we need to read from the CRM:

- Customer ID, phone (hashed), name.

- Tier (Silver / Gold / Platinum / Diamond), lifetime value, last visit date, visit count, preferred store, segments and VIP flag.

Default tier criteria (the client can override these): **Silver** — below ₹50,000 lifetime value. **Gold** — ₹50,000 to ₹3 lakh. **Platinum** — ₹3 lakh to ₹10 lakh. **Diamond / VIP** — above ₹10 lakh.

When a **Platinum or Diamond customer** enters a store, the Store Manager should get a real-time alert — both on the dashboard and on WhatsApp. For Diamond customers, the Brand Admin should be alerted too.

7. WhatsApp Business Integration

For development, please use Orzen Engineering's existing Meta Business account with a sandbox WhatsApp number from the BSP. For production, each client will bring their own Meta Business account and number.

Recommended BSP: **Gupshup** — the most established WhatsApp BSP in India, with strong jewellery-retail experience. **Interakt, Wati and Twilio** are good alternatives — same adapter pattern.

Notifications we need to send. For HR Director / Brand Admin:

- Tuesday morning weekly digest.
- Daily attendance summary (end of day).
- Compliance alerts (document expiries, statutory flags).

For Store Manager:

- End-of-day site summary.
- Approval queue reminder (when more than five items are pending for over a day).
- Exception alerts — late, no-show, overtime spike.
- VIP customer detected (real-time, as covered in Section 6).

For employees:

- Shift reminder (the evening before).
- Leave application status (on approve / reject).
- Payslip ready (monthly).
- Birthday / work-anniversary message (optional).

All templates must be registered with the Indian DLT and approved by Meta before going live.

Please get started on this basis. Where the build runs into a specific decision that needs more detail — a vendor's API quirk, a permission edge case, or a notification template — flag it and we will sort it together. As our first live client is onboarded, we'll firm up the actual specifics and replace the scenario assumptions above with real data.

Warm regards,

Sudeesh Shanmughan
